Report 282

April 15, 1935

ANALYSIS OF THE MICHIGAN CREEL CENSUS FOR THE YEAR 1933¹

The compilation of the 1933 Michigan creel census was directed by the staff of the Institute for Fisheries Research. The actual mechanics of compilation was done by the University of Michigan FERA under the writer's supervision.

As in previous years the data were collected largely by Michigan conservation officers. Unfortunately the return of cards for 1933 was less than for any of the previous years except 1927 and 1932. It is gratifying, however, that 1933 shows a substantial increase over 1932, and indications are that 1934 will show even better increase over 1933. On the other hand it is encouraging to note that despite the relatively few cards turned in for 1933 the total number of hours reported fished and the total number of fish caught is not far from the average for the previous five years (see Table 1).

The 1933 creel census data contain almost nothing from the intensive survey made by various CCC camps in Michigan. In only a very few lakes was that survey begun before January 1934 and then only in the latter part of December.

In all cases each table in this report corresponds to the table of the same number in Report 238. In other words the data in Table 1 of this report is of the same nature and was handled in the same manner as the data for Table 1 of Report 238. We have in some instances where space permitted, included in the tables for this report the averages for the five years previous, taken directly from the corresponding tables in Report 238. This will facilitate comparison, but in most cases the true picture is obtained only by comparing the tables from Report 238 with

¹ For thorough understanding of this report see Report 238.

the corresponding ones in this report. There is one exception to this comparison, Table 1a of the present report deals with entirely different data than does Table 1a of Report 238.

Table 2 indicates that the ratio of the reported fish catch between the three regions (Lower Peninsula ~~South~~ of Townline 20, Lower Peninsula ~~North~~ of Townline 20, and Upper Peninsula) stands in 1933 as 66:20:14. The records for 1928 to 1932 indicated that the most intensive fishing ^{was} in the region in the Lower Peninsula north of Townline 20. The ratio for 1933 appears to show a slackening of that intensity. This ratio points toward a greater intensity in the region south of Townline 20.

The percentage ratio for the three species of trout is 24:33:43 which is probably correlated with the seeming slackening of intensity of fishing in the region in the Lower Peninsula north of Townline 20. The change in both of the above ratios may ~~partially or entirely~~ ^{be due} to unusually poor returns from the Lower Peninsula north of Townline 20. A check with Table 1a shows that from two-thirds of the counties of this region there were 40 or less cards returned. In fact more than a third of all the counties of the state which ^w ~~shoed~~ 40 or less cards returned were from the Lower Peninsula north of Townline 20.

This deplorable lack of returns from the northern section of the Lower Peninsula is evident in the ratio of catch of GAME FISH (the two black bass, walleye and northern pike) which is 45% for the region south of Townline 20, 41% north of Townline 20 and 14% in the Upper Peninsula. For the five years previous this ratio was 31:54:15. Thus the 1933 report indicates a decided swing in the catch of game fish away from the region north of Townline 20 toward the southern section, while the same proportion occurs in the Upper Peninsula ~~as~~ in previous years. The same swing shows in the ratio of PAN FISH (bluegill, sunfish, rock bass, black crappie, perch), 83:12:5. This same inadequacy of data from north of Townline 20 is indicated in the ratio (83:11:6) of the PROPAGATED warm-water fishes (the two basses, bluegill, perch, walleye), and the ratio (61:30:8) of the NON-PROPAGATED fish (sunfish,

rock bass, crappie, pike, bullheads).

The high ratio of returns in the warm waters for the region south of Townline 20 may be due to the propagation effort of the lake species of that region.

The reported catch of both species of bass showed a decided preference for the region south of Townline 20, while the previous report indicated a preference on the part of the smallmouth for the region north of Townline 20. Of the species which were caught in significant abundance, perch and northern pike, showed a higher ratio in the region north of Townline 20, than for the previous five years.

The figures for tables 3a to 3d, are even more unreliable than those for Report 238 (see p. 15). Since in 1933 almost half of the counties (37) returned less than 40 reports for the entire year (less than one a week) and almost half of these returned less than 5 cards (less than one every two months), any ratio of species by counties is subject to great error.

Tables 4a to 4c by combining the data for the counties as given in tables 3a to 3d, eliminate such excessive fluctuations as were due to lack of data from some counties and the great amount of data from others. One of the interesting facts brought out in these tables is that of the total fish catch for 1933 the percentage of trout for the entire state was lower in each region than that of the average for the five years previous, but higher in the two northern regions than for the previous year, 1932. Bluegills in the region south of Townline 20 showed a significant increase over the average for the previous five years as well as over 1932. This increase in the lower region affected the average for the entire state. Perch and northern pike showed an increase in the region north of Townline 20.

Tables 5 and 6 show the relative abundance of the various trouts first by counties (Table 5) and their by regions (Table 6). These tables show very little of significant difference from the corresponding tables of Report 238. There may be some significance to the apparent increase in the percentage of brown trout in the region south of Townline 20. There also may be a significant decrease in the proportion of rainbows in the same region.

Tables 7a and 7b contain not only the percentage of the total catch for 1933 which each species represents, but, since space permitted, the average yearly figure for 1928 to 1932 has been included. In the figures for the entire state the only very striking item is the decided increase of bluegills in the 1933 catch. This is counterbalanced by an almost equal decrease in the perch catch for 1933. Otherwise the figures for the entire state are remarkably constant in the two columns. The regional percentages show slightly more fluctuation but are surprisingly similar nevertheless.

The figures for relative abundance of species in counties (Tables 8a to 8d), are based on too irregular reports to be of much significance.

Tables 9a and 9b again contain the yearly averages for the five years preceding 1933. In the region south of Townline 20 about 75% of the counties show an increase in the relative abundance of bluegills, while only about 50% show this increase in the region north of Townline 20 and about 25% in the Upper Peninsula.

Tables 10 to 14 give the per hour catch of all species of fish for all waters during 1933 and in all cases contain the yearly average for the five previous years. These tables are in many ways the most interesting as they represent the returns per unit of effort for the fisherman. In many counties the number of hours fished is too small to be of any significance but many counties show an interesting comparison with the previous five years. For instance Cass and Branch counties with over 1000 hours of fishing show a decided increase in catch per hour; Wayne with almost 3000 hours has almost a constant ratio with the previous five year average; Gladwin with almost 4000 hours of fishing has a slight increase in catch per hour and Arenac and Lake with 1600 and 6800 hours of fishing respectively show decided decreases in catch per hour. The figures upon which the 1928-1932 averages are based represent sufficient fishing hours to be seemingly significant. Similarly in the region north of Townline 20 the three counties (Roscommon, Iosco, Cheboygan) with approximately 1000 or over hours of fishing show in one case an increase,

once a decrease and once virtually the same catch per hour. In the Upper Peninsula the four counties (Menominee, Iron, Marquette, Houghton) with approximately 1000 hours or over of fishing, showed a decrease in catch per hour.

Tables 11a and 11b deal only with the trout caught in essentially trout waters. In this case there has been a decided decrease in catch per hour in all three regions although the drop in the region north of Townline 20 is hardly enough to be significant.

Tables 12a and 12b give the catch per hour for all species except trout and in essentially non-trout waters. Here there is a decided increase in the catch per hour in the region south of Townline 20, a fair increase in the region north of Townline 20, and a slight decrease in the Upper Peninsula. Table 13a gives a possible explanation of the increase in the southern region. The catch of bluegills in the southern part of the state was greatly increased; in a third of the counties of this region the bluegill catch was doubled or better. The bluegill catch north of Townline 20 and in the Upper Peninsula was conspicuously low.

Tables 14a and 14b, smooth off the inconsistencies of incomplete county returns and give a fairly good picture of the fishing trend by species and regions. It will be noted that the catch per hour of all species in all waters in the Lower Peninsula south of Townline 20 was somewhat better than the average for the five previous years, though not as high as two individual years of those five (see Table 14a, Report 238). The catch north of Townline 20 was not only better than the average for the five years previous but better than any individual year of those five, while that of the Upper Peninsula was less than any of the previous five years. The catch for the entire state was 12% better than the previous five year average and exceeded all the individual years except 1932. The catch for that year was 1.26 per hour of fishing. The values for all species in non-trout waters have about the same ratio to the catch from 1928 to 1932.

The catch of all trout in trout waters shows a very different picture. Here there is a drop in catch per hour in all regions and the drop for the whole state is about 25%. There was the largest decrease in the region south of Townline 20, but that region is not essentially trout waters. The region north of Townline 20 came the nearest to the average of the previous five years, but the Upper Peninsula also lost significantly. The next three items in Table 14a show that this loss in return trout ~~was in the brook trout~~. While the brown and rainbow catch in Michigan ~~is~~ ^{was} relatively light there was virtually no loss in brown and only a slight loss in rainbows but the drop in brook trout catch for the entire state was about 33%. This drop was significant in all regions but most apparent in the region south of Townline 20 and in the Upper Peninsula. There was an increase in the returns for the five propagated species (large and smallmouth bass, bluegills, perch and walleyes), the only drop being in the Upper Peninsula, while the non-propagated species (common sunfish, rock bass, black crappie, northern pike and bullheads) stand about the same as the five previous years except for the Lower Peninsula north of Townline 20. Consequently the ratio of the five propagated species to the five non-propagated species increases in all but the one region, Lower Peninsula north of Townline 20. It is seen from Table 14b that the real gain in catch per hour of propagated fish is in the bluegills. The figures for both black basses and the walleye are almost identical with the average for the previous five years. The perch show a decrease in the region south of Townline 20 and in the Upper Peninsula, but increased in the region north of Townline 20. However the average for the entire state is not far from the average for the previous five years. The returns for the five non-propagated fish are virtually identical with preceding years except for the northern pike. For this species there was a sharp increase north of Townline 20 but a moderate drop in the other two regions making for a state average virtually the same as for 1928 to 1932.

General conclusions on the present status of the Michigan creel
census

The 1933 creel census, in spite of its regrettable lack of returns still indicates the general trend of fishing in Michigan. However, it is somewhat disheartening to have many returns from a county one year and virtually none the next. Even these inconsistencies will not be so vital over a long period. Since the best returns from individual counties can be compared even though not for consecutive years. In order to obtain the fullest benefit it is imperative that this creel census be continued over a long period of time and that there be more adequate and uniform yearly returns from all counties.

As brought out in Report 238 much valuable information can still be obtained from the data already available. Lack of time and funds have prevented us from obtaining this valuable information.

The 1934 returns are now being tabulated again with the aid of FERA. A report for 1934 similar to this report for 1933 can only be compiled when all returns for 1934 are in our hands.

TABLE 5a. RELATIVE ABUNDANCE OF BROOK, BROWN AND RAINBOW TROUT BY COUNTIES OF
LOWER PENINSULA SOUTH OF TOWNLINE 20

Exclusive of the few trout caught in essentially non-trout waters. The figures represent the percentage of the total catch of these three species for each county. 0 indicates that no trout of this species was reported, though some trout fishing was reported for the county. 100 indicates that only this species of trout was reported from the county. - (dash) indicates that no trout fishing at all was reported.

TABLE 6. SUMMARY OF COMPUTATIONS ON RELATIVE ABUNDANCE OF TROUT

Inclusive of the few trout caught in essentially non-trout waters. The figures represent the percentage of the total catch of these three species for each region.

Species	Region	1933	Percentage
Brook trout	1. Lower Peninsula S. of T. 20	1895	72.7
	2. Lower Peninsula N. of T. 20	2996	82.8
	3. Upper Peninsula	4199	90.2
	4. Entire state	9090	83.5
Brown trout	1. Lower Peninsula S. of T. 20	332	12.7
	2. Lower Peninsula N. of T. 20	156	4.3
	3. Upper Peninsula	7	0.2
	4. Entire state	495	4.5
Rainbow trout	1. Lower Peninsula S. of T. 20	381	14.6
	2. Lower Peninsula N. of T. 20	467	12.0
	3. Upper Peninsula	450	9.7
	4. Entire state	1298	11.9
Totals	1. Lower Peninsula S. of T. 20	2608	100.0
	2. Lower Peninsula N. of T. 20	3619	100.0
	3. Upper Peninsula	4656	100.1
	4. Entire state	10883	99.9

TABLE 7a. SUMMARY OF COMPUTATIONS ON RELATIVE ABUNDANCE OF THE MAIN WARM-WATER FISHES WITHIN EACH REGION, FIRST PART: MORE IMPORTANT SPECIES.

The figures represent the percentage of the total catch of fish in non-trout waters, for each region and year.

Species	Region	1933	Ave. 1928-1932
Small-mouth Bass	1. Lower Peninsula south of T. 20	1.7	1.2
	2. Lower Peninsula North of T. 20	0.7	3.3
	3. Upper Peninsula	5.5	2.9
	4. Entire state	1.9	2.0
Large-mouth Bass	1. Lower Peninsula south of T. 20	4.0	4.7
	2. Lower Peninsula north of T. 20	0.9	1.9
	3. Upper Peninsula	5.3	2.9
	4. Entire state	3.6	3.7
Blue-gill	1. Lower Peninsula south of T. 20	57.4	42.2
	2. Lower Peninsula north of T. 20	2.0	11.0
	3. Upper Peninsula	3.4	1.7
	4. Entire state	44.0	29.5
Common Sunfish	1. Lower Peninsula south of T. 20	4.1	6.0
	2. Lower Peninsula north of T. 20	4.2	3.3
	3. Upper Peninsula	2.2	0.6
	4. Entire state	4.0	4.7
Rock Bass	1. Lower Peninsula south of T. 20	3.1	4.7
	2. Lower Peninsula north of T. 20	8.9	9.4
	3. Upper Peninsula	4.4	4.1
	4. Entire state	4.2	6.0
Black Crappie	1. Lower Peninsula south of T. 20	4.8	5.4
	2. Lower Peninsula north of T. 20	0.1	0.9
	3. Upper Peninsula	0.3	0.2
	4. Entire state	3.7	3.6
Perch	1. Lower Peninsula south of T. 20	8.1	22.8
	2. Lower Peninsula north of T. 20	35.3	30.3
	3. Upper Peninsula	34.7	47.8
	4. Entire state	14.7	27.2
Walleye	1. Lower Peninsula south of T. 20	2.5	6.7
	2. Lower Peninsula north of T. 20	5.5	5.6
	3. Upper Peninsula	5.2	9.6
	4. Entire state	3.2	2.9
Northern pike	1. Lower Peninsula south of T. 20	1.3	2.5
	2. Lower Peninsula north of T. 20	31.8	24.3
	3. Upper Peninsula	12.4	15.4
	4. Entire state	7.2	10.0
Bullheads	1. Lower Peninsula south of T. 20	7.5	6.3
	2. Lower Peninsula north of T. 20	2.0	5.0
	3. Upper Peninsula	8.0	3.3
	4. Entire state	6.6	5.6

TABLE 7b. SUMMARY OF COMPUTATIONS ON RELATIVE ABUNDANCE OF THE WARM-WATER FISHES
WITHIN EACH REGION, SECOND PART: FOR LARGER GAME-FISHES VS. PAN-FISHES, AND
FOR MINOR SPECIES

For further explanation see Table 7a.

Species	Region	1933	Ave. 1928-1932
Larger game-fishes ¹	1. Lower Peninsula south of T. 20	9.5	9.1
	2. Lower Peninsula north of T. 20	38.9	35.1
	3. Upper Peninsula	28.4	30.8
	4. Entire state	15.9	18.6
Pan-fishes ²	1. Lower Peninsula south of T. 20	77.5	81.1
	2. Lower Peninsula north of T. 20	59.5	54.9
	3. Upper Peninsula	45.0	54.3
	4. Entire state	70.6	71.1
Ratio: pan-fish to game-fishes	1. Lower Peninsula south of T. 20	8.2	8.9
	2. Lower Peninsula north of T. 20	1.3	1.6
	3. Upper Peninsula	1.6	1.8
	4. Entire state	4.4	3.8
Smelt	1. Lower Peninsula south of T. 20	0.0	0
	2. Lower Peninsula north of T. 20	8.3	2.5
	3. Upper Peninsula	0.3	0
	4. Entire state	1.4	0.7
Cisco & White-fish	1. Lower Peninsula south of T. 20	0.0	tr.
	2. Lower Peninsula north of T. 20	tr.	0.6
	3. Upper Peninsula	7.7	2.5
	4. Entire state	0.6	0.4
Mullets, Suckers, and Red-fish	1. Lower Peninsula south of T. 20	1.4	1.6
	2. Lower Peninsula north of T. 20	tr.	1.4
	3. Upper Peninsula	7.2	8.1
	4. Entire state	1.6	2.1
Carp	1. Lower Peninsula south of T. 20	3.3	1.1
	2. Lower Peninsula north of T. 20	0.0	0.1
	3. Upper Peninsula	0.0	0.7
	4. Entire state	2.5	0.8
Other Species and Un-named	1. Lower Peninsula south of T. 20	0.6	0.7
	2. Lower Peninsula north of T. 20	0.2	0.4
	3. Upper Peninsula	3.3	0.3
	4. Entire state	0.6	0.6

¹ Four important species (small-mouth and large-mouth bass, walleyes and northern pike) added together. Other game-fishes, as the muskallunge, lake trout, etc., are caught in proportionately immaterial numbers.

² Five species, (bluegill, common sunfish, rock bass, black crappie, and perch) added together. Bullheads, smelt and ciscoes are excluded. Other species, coming under the term "pan-fish" are caught in immaterial numbers.

TABLE 8a. RELATIVE ABUNDANCE OF THE MAIN WARM-WATER FISHES, FOR 1933, IN COUNTIES OF THE LOWER PENINSULA SOUTH OF TOWNLINE 20.

The figures represent the percentage of the total reported catch of fish in non-trout waters, for each county, which total is given in the first column. Unless this total amounts to several hundred, the relative abundance figures are of low reliability. Tr. = trace, less than 0.05%. 0 indicates that no fish of the given species was reported for the county, although some fishing was reported for the county.

County	Total catch, non- trout waters	<u>BLACK BASS</u>				Common Sunfish	Rock Bass	Black Crappie	Perch	Walleye	Northern pike	Bull heads	Gars	Dogfish	Smelt

		3. Upper Peninsula	2.07	2.70
		4. Entire state	2.66	2.10

¹ Large-mouth and small-mouth bass, bluegills, perch and walleyes.

² Common sunfish, rock bass, black crappie, northern pike and bullheads.

TABLE 14b. SUMMARY OF COMPUTATIONS OF TOTAL FISH CATCH PER HOUR, SECOND PART,
FOR MORE IMPORTANT SPECIES IN NON-TROUT WATERS.

Species	Region	Average 1933	Average 1928-1932
Small-mouth bass	1. Lower Peninsula S. of T. 20	0.02	0.02
	2. Lower Peninsula N. of T. 20	tr.	0.02
	3. Upper Peninsula	0.06	0.03
	4. Entire state	0.02	0.02
Large-mouth bass	1. Lower Peninsula S. of T. 20	0.06	0.06
	2. Lower Peninsula N. of T. 20	tr.	0.01
	3. Upper Peninsula	0.05	0.03
	4. Entire state	0.04	0.03
Blue-gill	1. Lower Peninsula S. of T. 20	0.89	0.57
	2. Lower Peninsula N. of T. 20	0.02	0.07
	3. Upper Peninsula	0.04	0.02
	4. Entire state	0.55	0.29
Common sunfish	1. Lower Peninsula S. of T. 20	0.07	0.08
	2. Lower Peninsula N. of T. 20	0.03	0.02
	3. Upper Peninsula	0.03	0.01
	4. Entire state	0.05	0.05
Rock bass	1. Lower Peninsula S. of T. 20	0.05	0.06
	2. Lower Peninsula N. of T. 20	0.07	0.06
	3. Upper Peninsula	0.05	0.05
	4. Entire state	0.06	0.06
Black Crappie	1. Lower Peninsula S. of T. 20	0.06	0.07
	2. Lower Peninsula N. of T. 20	tr.	tr.
	3. Upper Peninsula	tr.	tr.
	4. Entire state	0.03	0.03
Perch	1. Lower Peninsula S. of T. 20	0.13	0.32
	2. Lower Peninsula N. of T. 20	0.27	0.18
	3. Upper Peninsula	0.38	0.54
	4. Entire state	0.20	0.27
Walleye	1. Lower Peninsula S. of T. 20	0.04	0.01
	2. Lower Peninsula N. of T. 20	0.04	0.03
	3. Upper Peninsula	0.05	0.11
	4. Entire state	0.04	0.04
Northern Pike	1. Lower Peninsula S. of T. 20	0.02	0.03
	2. Lower Peninsula N. of T. 20	0.24	0.14
	3. Upper Peninsula	0.13	0.17
	4. Entire state	0.10	0.09
Bullheads	1. Lower Peninsula S. of T. 20	0.12	0.09
	2. Lower Peninsula N. of T. 20	0.02	0.03
	3. Upper Peninsula	0.07	0.03
	4. Entire state	0.08	0.06
