

Compartment Review Presentation

Shingleton Forest Management Unit

Compartment 41157

Entry Year 2024

Acreage: 2,586

County Schoolcraft

Management Area: Seney Manistique Swamp

Stand Examiner: Mario Molin

Legal Description:

T. 46N, R16W, Sections 21,22,23,26,27,28

Identified Planning Goals:

The main goal in this compartment is to conduct sound multiple resource management for the good of the citizens of the State of Michigan.

Soil and topography:

Land is mainly level with scattered sandy knolls/rises. Many lowland areas are interspersed between uplands.

Ownership Patterns, Development, and Land Use in and Around the Compartment:

An 80 acre private parcel is located within the Southeast corner of the Compartment. Additional private holdings are situated adjacent to the Compartment to the Northeast and Southeast. The Compartment is surrounded mainly by a large block of state property. Intensive forest cutting in a northern hardwoods type has occurred in the recent past on the private property setting immediately to the Northeast.

Unique Natural Features:

The rare northern blue butterfly (*Lycaeides idas nabokovi*, state threatened) has been recently documented in the compartment. This species typically occurs in open sandy or rocky habitats, including patches within jack pine or spruce forests and along right-of-ways. It is often associated with its larval host plant, dwarf bilberry (*Vaccinium cespitosum*, state threatened), which has been reported southwest of the compartment. Adults are typically active from early June through mid July, at which time eggs are laid on or near the host plant. This species does not migrate. Instead, eggs overwinter and hatch the following spring.

Archeological, Historical, and Cultural Features:

Special Management Designations or Considerations:

Watershed and Fisheries Considerations:

The eastern region of this compartment borders the Creighton River. The Creighton River is a designated Type 1 trout stream less than 50' width with a predicted mean July temperature of 64.8 °F (cold stream). 300' buffers are recommended for the Creighton River in riparian areas susceptible to Aspen regeneration. For areas not susceptible to Aspen regeneration, 100' plus 5' per 1% increase in slope; buffers are recommended to protect these areas in accordance with Best Management Practices.

Wildlife Habitat Considerations:

This compartment lies within the Seney Sand Lake Plain ecological sub-subsection. The growing season in this area is less than 100 days with extreme minimum winter temperatures of -46o F. Annual snowfall in this area averages approximately 150 inches.

The compartment falls within the Seney Manistique Swamp Management Area which highlights the following Featured Species: Moose, sharp-tailed grouse, snowshoe hare and white-tailed deer. This compartment lies within the marsh/low pine ridge complex. The land form has a general NNW to SSE slope with upland islands surrounded by marsh and lowland coniferous forests. General Land Office (GLO) Surveyor notes show the circa 1850 upland forest was dominated by a mixture of hemlock, white pine, yellow birch, and red maple. Balsam fir, beech, cedar and spruce were also recorded. Tamarack and black spruce were by far the dominant lowland forest species. However, cedar, white pine, hemlock, jack pine, white birch, and tag alder were also present. Windthrow, fire, flooding, and beaver ponding all likely played major roles in the natural disturbance regime. Surveyors mentioned beaver ponding activity during their work in the township. Current forests in this compartment are substantially different from the circa 1850 conditions. Jack pine is by far the dominant tree species within the compartment. Aspen is more prevalent than before. Northern hardwood stands contain more deciduous and less hemlock/white pine component than during pre-settlement times. Spruce and

tamarack are still the primary tree species in the lowland areas.

Wildlife habitat objectives in this compartment include maintaining age and structural diversity between conifer stands, maintaining wildlife travel corridors across the landscape, promoting within stand diversity in the northern hardwood areas, and protection the integrity of the sheet flow of water across the compartment.

Moose (Michigan special concern), and the northern blue butterfly (Michigan threatened) occur within this compartment. Other wildlife species of interest that may utilize this compartment include spring peepers, leopard frogs, great blue heron, northern harrier, red squirrel, and bobcat.

Mineral Resource and Development Concerns and/or Restrictions

Surface sediments consist of lacustrine (lake) sand and gravel and peat and muck. There is insufficient data to determine the glacial drift thickness. The Ordovician Black River Group subcrops below the glacial drift. The Black River is used for stone/dolomite in the UP. Gravel pits are located three miles to the west and potential appears to be limited. There is no commercial oil and gas production in the UP.

Vehicle Access:

Two primary 2-tracks provide access to the interior of the Compartment, West of the Creighton county road. Both are relatively drivable, though they also flood seasonally. One of the 2-tracks follows the East-West running powerline ROW. This road has many mucky, unstable areas which would pose access problems nearly year-round the further West you go. The 2-track becomes impassable at about the center of section 27, near the drain. The second 2-track is mainly a firm, sandy road which ends in unstable, mucky soil near the ¼ corner between sections 21 and 22. The Northwest corner of the Compartment is remote and inaccessible. A moderately hard-packed, passable 2-track provides loop access to the northern stands east of the Creighton road.

Survey Needs:

Recreational Facilities and Opportunities:

One dispersed campsite is situated along the northeast 2-track, near the Creighton River in section 22. This site is used by deer hunters. A second dispersed camping site is found near the Pines Powerline Substation, on the powerline ROW East of the Creighton road. This site is also used by deer hunters. ATV tracks are very numerous on the powerline ROW, especially during hunting seasons.

Fire Protection:

Fire suppression equipment will have difficult access in most areas due to lack of roads and well-dispersed wetlands/drainages.

Additional Compartment Information:

The following reports from the Inventory are attached:

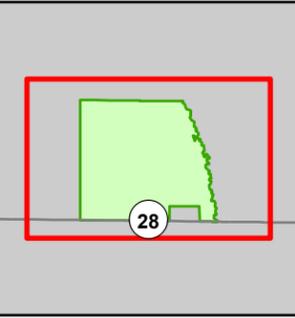

- Total Acres by Cover Type and Age Class**
- Cover Type by Harvest Method**
- Proposed Treatments – No Limiting Factors**
- Proposed Treatments – With Limiting Factors**
- Stand Details (Forested and Nonforested)**
- Dedicated and Proposed Special Conservation Areas**
- Site Condition Details**

The following information is displayed, where pertinent, on the attached compartment maps:

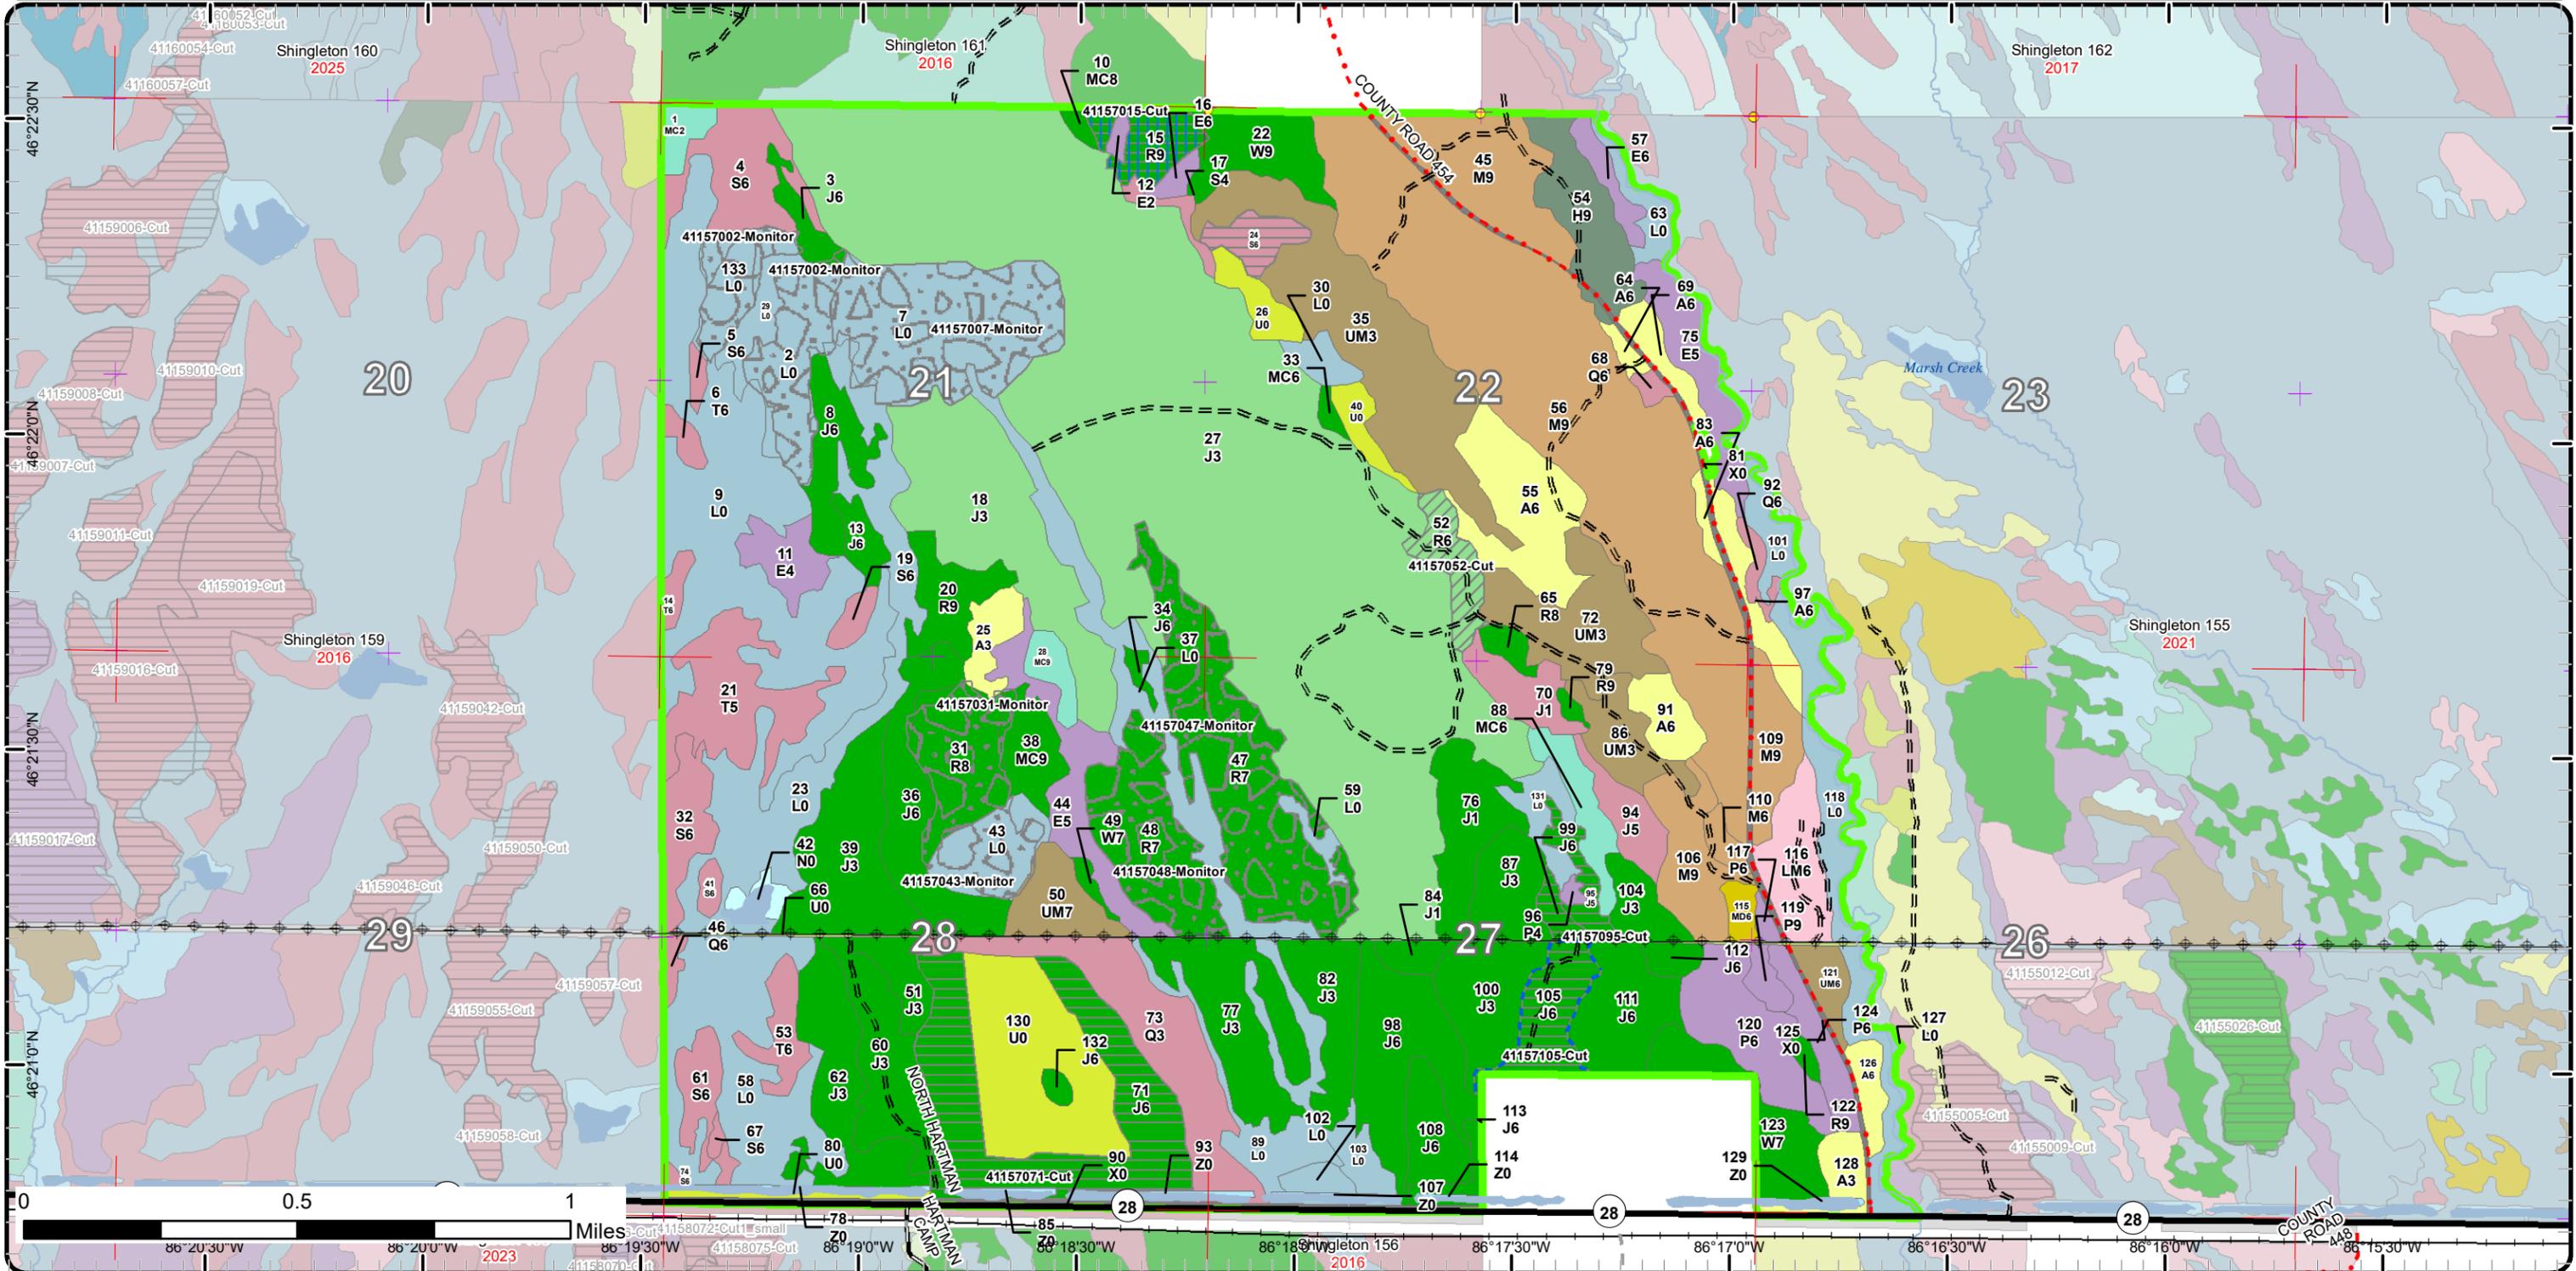

- Base feature information, stand boundaries, cover types, and numbers**
- Proposed treatments**
- Site condition boundaries**
- Details on the road access system**

Report 5 – PROPOSED SPECIAL CONSERVATION AREA* (SCA) DETAILS

* This is a partial list of SCAs for this compartment. Not included are those areas identified under other Department initiatives (Natural Rivers, Deer Wintering Areas, etc.). Those will be identified in separate, future map and report products.

SCA Name	SCA Category	Detail Type	Recommendation	Acres
----------	--------------	-------------	----------------	-------

Comments

Report 6 – EXISTING SPECIAL CONSERVATION AREA DETAILS

* This is a list of SCA's for this compartment along with a 1/4 mile buffer surrounding the compartment. Refer to the Special Conservation Area Map for locations of the below listed Conservation Areas.

ERA = Ecological Reference Area
HCVA = High Conservation Value Area
SCA = Special Conservation Area

Conservation Area	Type	Description
SCA	Cold Water Stream	A coldwater stream has temperature and dissolved oxygen conditions that allow naturally-reproduced or stocked trout populations and those of other coldwater fish species (e.g., slimy sculpin) to persist from year to year. Coldwater streams in Michigan typically provide these conditions due to substantial contributions of groundwater to their stream flows. Such streams are established by Director's action and designated as trout resources by Fisheries Order 210.
ERA	Ecological Reference Areas	Ecological Reference Areas (ERAs) are high quality examples of natural communities that have been identified as Element Occurrences (EOs) by the Michigan Natural Features Inventory (MNFI) within the context of their natural community classification system. Element Occurrences with viability ranks of A (Excellent) or B (Good) and a Global (G) or State (S) element (rarity) ranking of endangered (1), threatened (2), or rare (3) serve as an initial base of ERAs. They may be located upon any ownership in the State. The system is comprised of individual or associations of natural community types that are managed for restoration and maintenance of natural ecological processes and values. The public may submit recommendations for lands as ERAs using the DNR Conservation Area Recommendation Form.
